

# Segmentation of scanning transmission electron microscopy (STEM) images with unsupervised machine learning

Ning Wang, Christoph Freysoldt, Christian Liebscher, and Jörg Neugebauer

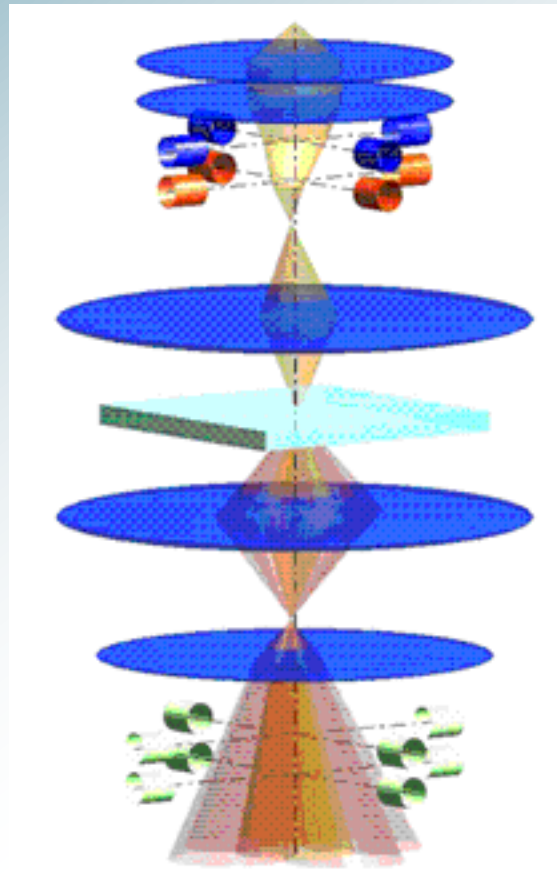

Max-Planck-Institut  
für Eisenforschung GmbH

Department of Computational Materials Design  
Düsseldorf, Germany

June 15, 2020

# Working principle of STEM

Scanning  
beam

Lens

Sample

Lens

Lens

Detector  
plane

## Materials properties

Supervised,  
**Unsupervised**,  
machine learning

[https://sergioskar.github.io/Semantic\\_Segmentation/](https://sergioskar.github.io/Semantic_Segmentation/) HAADF-STEM image of a Cu grain boundary

## An unsupervised approach

- Free of training.
- Segmenting images according to local symmetry

HAADF-STEM  
images

Local-symmetry  
descriptors

Principal component  
analysis

K-means clustering

Scoring  
symmetry:

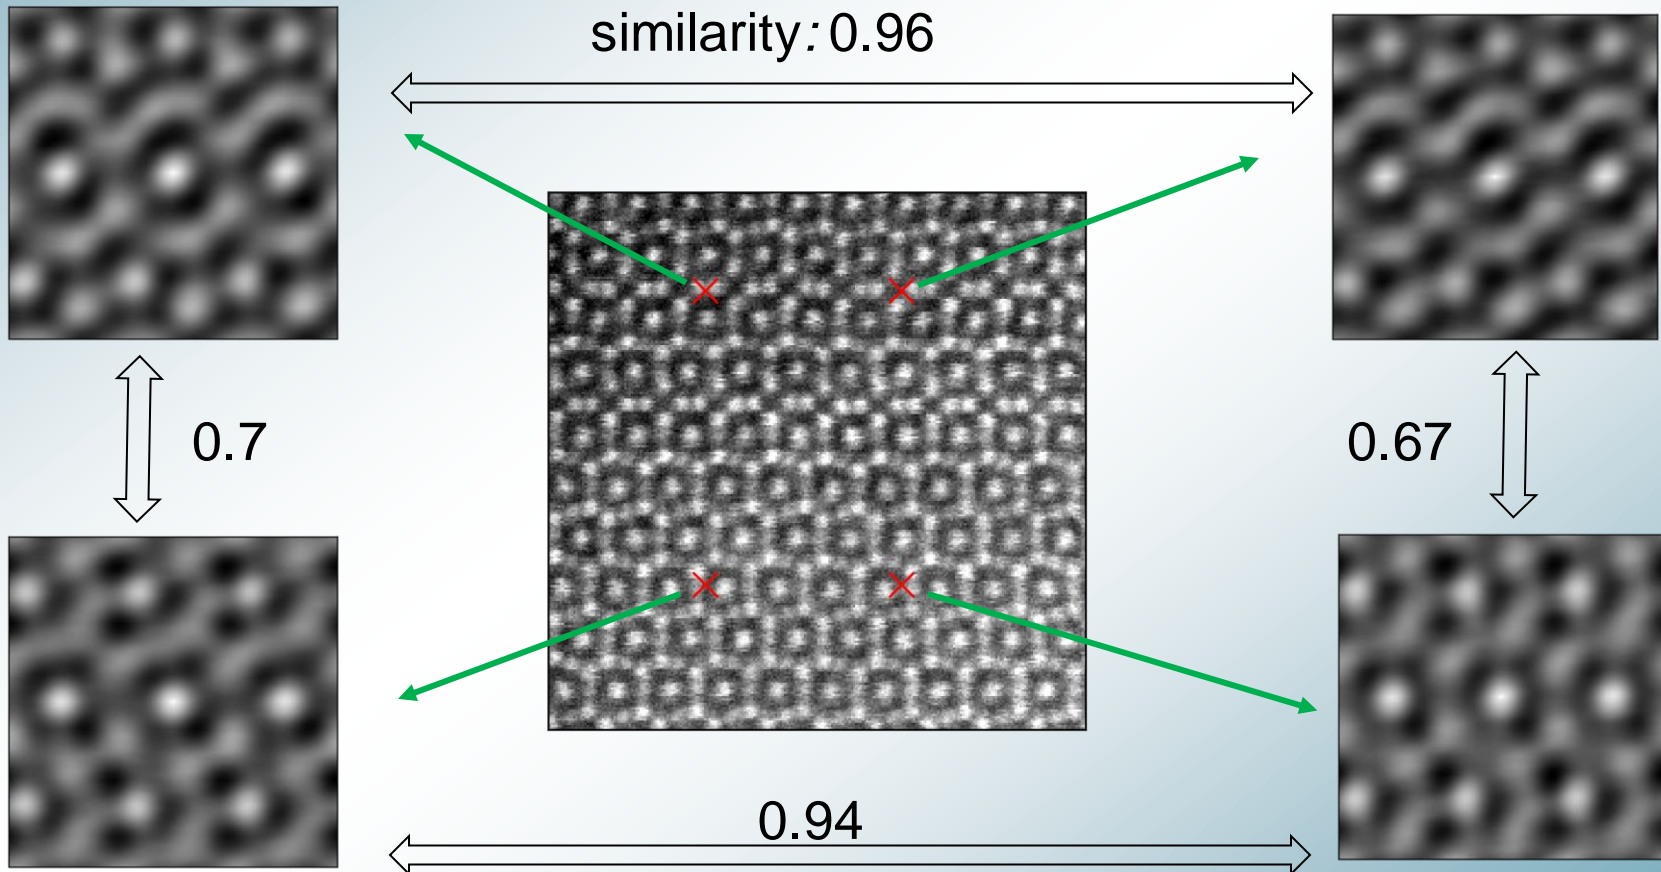

Pearson correlation coefficient

$$\rho_{XY} = \frac{\text{Cov}(X, Y)}{\sigma_X \sigma_Y}$$

X: original patch  
Y: transformed patch

Pixels in same crystal pattern have *similar* local descriptors

# Principal component analysis

PCA

Abundance of local descriptors

A few PCA features

STEM image

Pixels projected into PCA component space

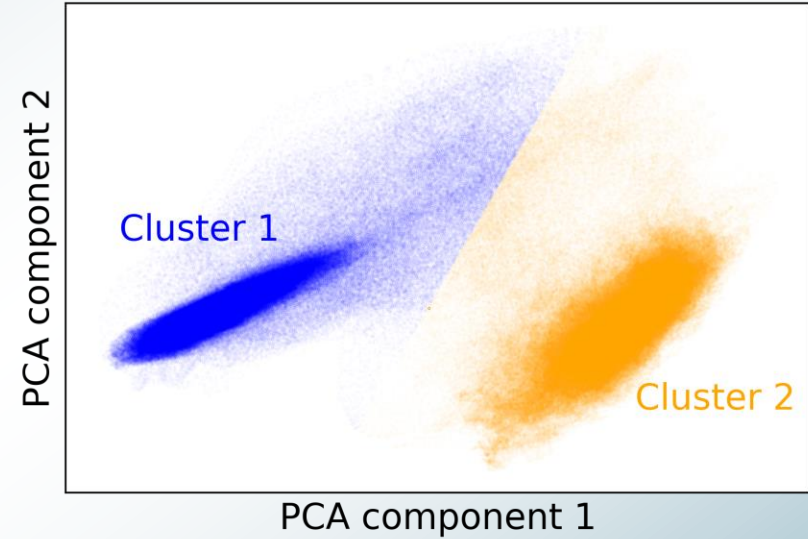

Abundance of local descriptors

A few of PCA features

# K-means clustering

- One-to-one correspondence between crystal patterns and clusters.
- clustering module in scikit-learn is used, <https://scikit-learn.org>.

Raw images

Segmented images

Interface between matrix and precipitate

Stacking fault

Twin boundary

phase boundary
