

Java + VW

**Jon Morra** and Ryan Deak

# Desired Properties

What we want in a library

# Fast

---

(Process Pipes)

# Strong Typing

```
public static <T extends VWLearner> T create(final String command) {
    long nativePointer = initialize(command);
    VWReturnType returnType = getReturnType(nativePointer);

    switch (returnType) {
        case ActionProbs: return (T)new VWActionProbsLearner(nativePointer);
        case ActionScores: return (T)new VWActionScoresLearner(nativePointer);
        case Multiclass: return (T)new VWMulticlassLearner(nativePointer);
        case Multilabels: return (T)new VWMultilabelsLearner(nativePointer);
        case Prob: return (T)new VWProbLearner(nativePointer);
        case Scalar: return (T)new VWScalarLearner(nativePointer);
        case Scalars: return (T)new VWScalarsLearner(nativePointer);
        case Unknown:
        default:
            // Doing this will allow for all cases when a C object is made to be closed.
            closeInstance(nativePointer);
            throw new IllegalArgumentException("Unknown VW return type using command: " + command);
    }
}
```

# Thread Safety

Thread 1

Thread 2

Thread 3

\*Except in case of multiple passes

# How to build it

```
jon.morra:vowpal_wabbit/ (master) $ make
cd vowpalwabbit; /Applications/Xcode.app/Contents/Developer/usr/bin/make -j 8 things
make[1]: Nothing to be done for `things'.
jon.morra:vowpal_wabbit/ (master) $ make java
cd vowpalwabbit; /Applications/Xcode.app/Contents/Developer/usr/bin/make -j 8 things
make[1]: Nothing to be done for `things'.
cd java; /Applications/Xcode.app/Contents/Developer/usr/bin/make things

# Example Usages

## Real Example

```
String cmd = "--quiet --loss_function logistic --link logistic -f foo.model";
WVScalarLearner m = VWLearners.create(cmd);
for (int i=0; i<100; ++i) {
    m.learn( example: "-1 | ");
    m.learn( example: "1 | ");
}
m.close(); // Can be slow if using multiple passes!!!!

float expVwOutput = 0.50419676f;
m = VWLearners.create("--quiet -i foo.model");
assertEquals(expVwOutput, m.predict( example: "| "), delta: 0.0001);
```

# Example Usages

## Simple Model

```
VWScalarLearner m = VWLearners.create("--quiet --loss_function logistic --link logistic -f basic.model");
```

float	<b>learn(String</b> example)	Runs learning on example and returns the prediction output.
-------	------------------------------	---

float	<b>learn(String[]</b> example)	Runs learning on example and returns the prediction output.
-------	--------------------------------	---

float	<b>predict(String</b> example)	Runs prediction on example and returns the prediction output.
-------	--------------------------------	---

float	<b>predict(String[]</b> example)	Runs prediction on example and returns the prediction output.
-------	----------------------------------	---

protected float	<b>predict(String</b> example, boolean learn, long nativePointer)	
-----------------	--	--

protected float	<b>predictMultiline(String[]</b> example, boolean learn, long nativePointer)	
-----------------	---	--

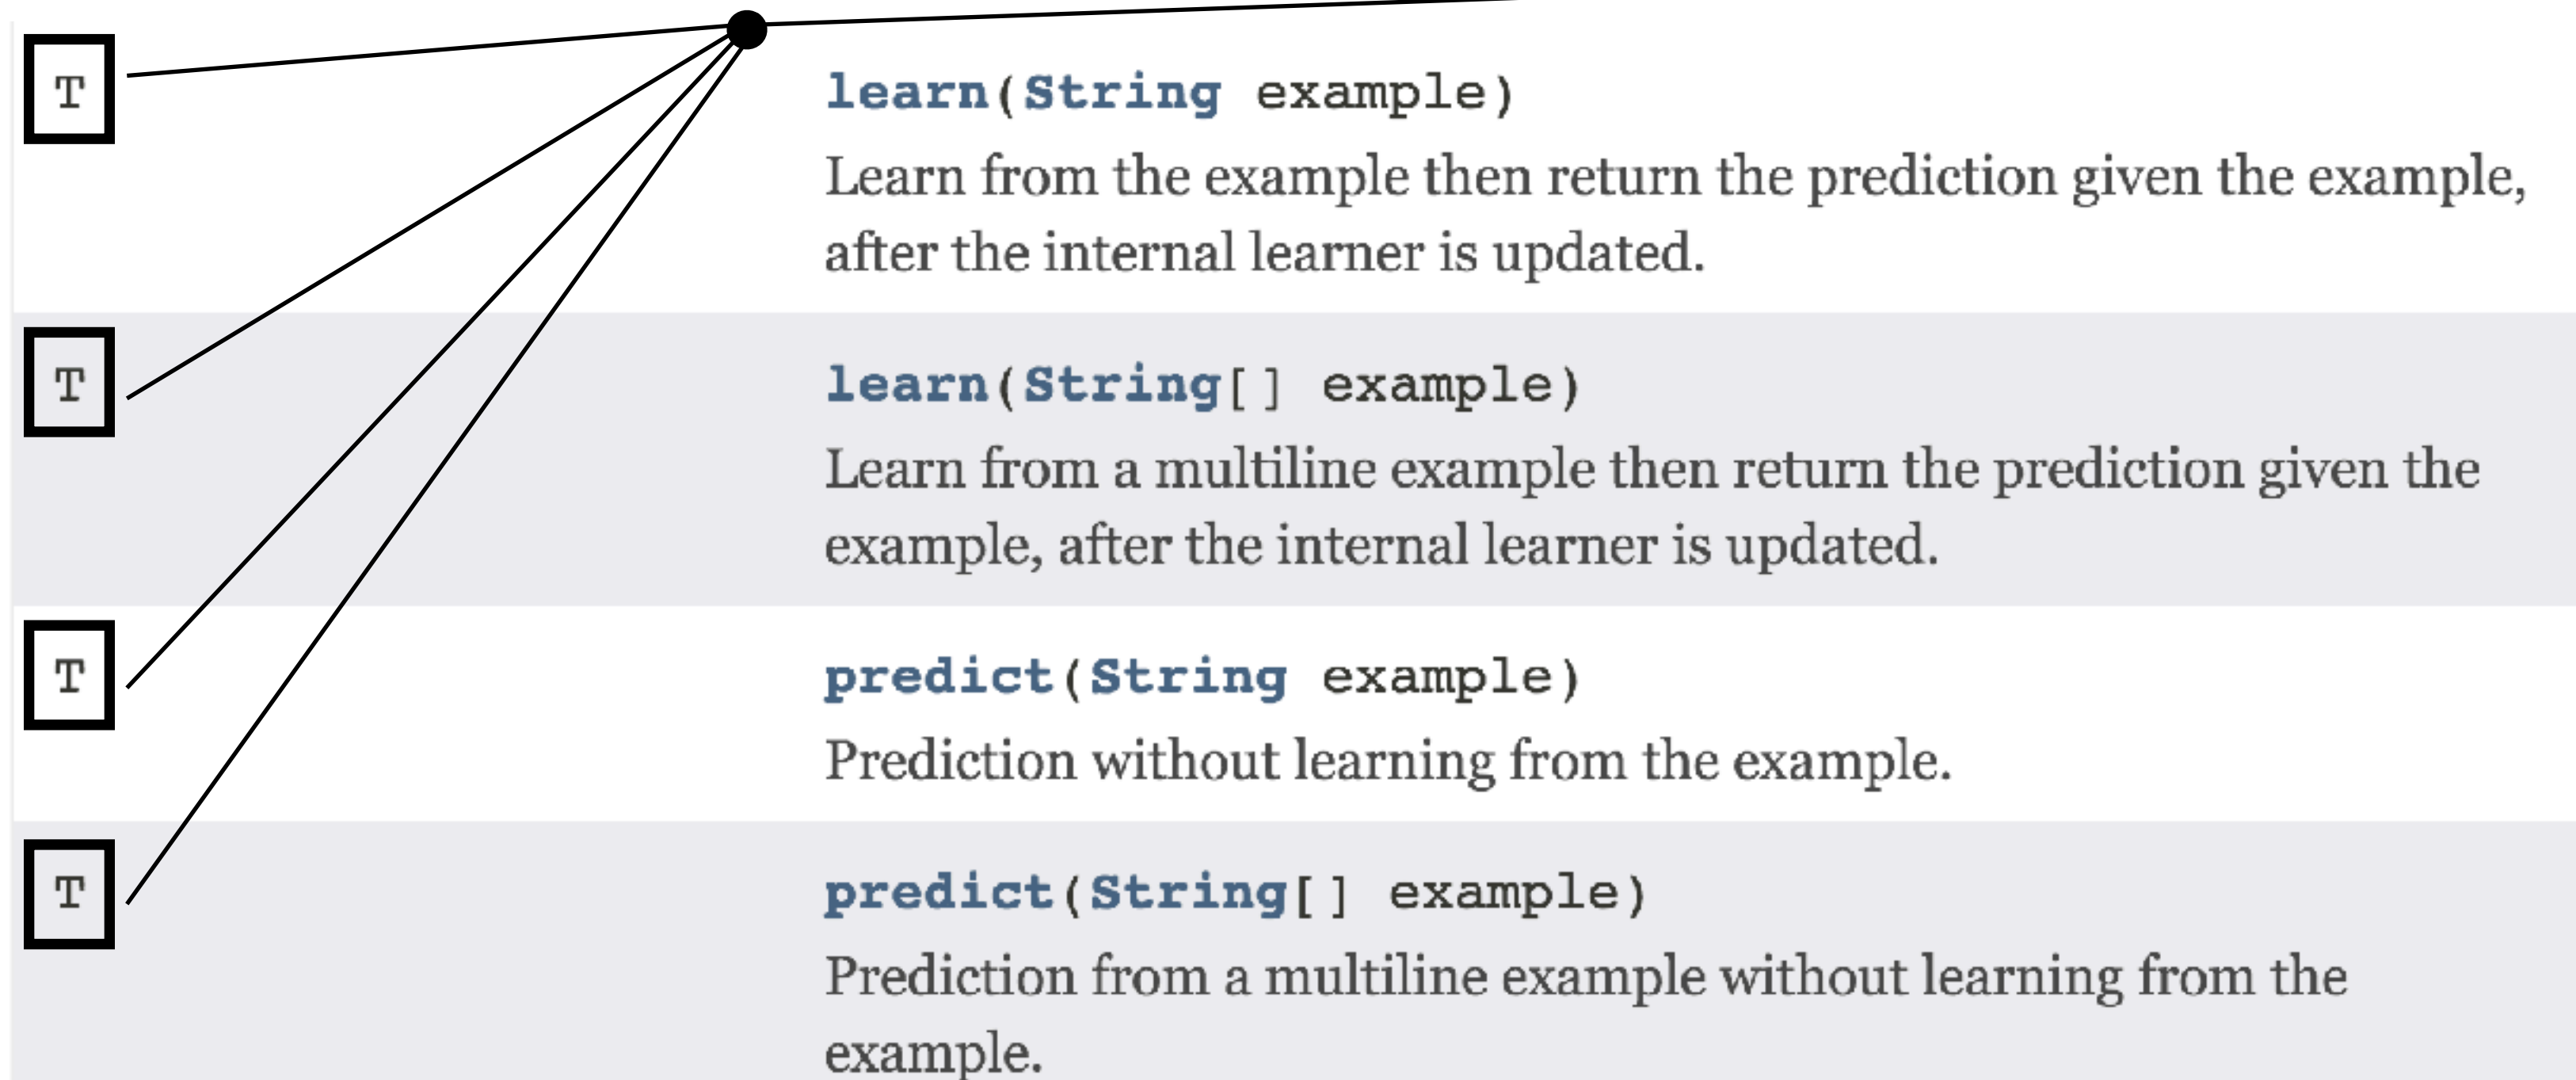

# Example Usages

## CBADF Model

```
VWActionScoresLearner vw = VWLearners.create("--quiet --cb_adf -f cbadf.model");
```

All Implemented Interfaces:

Closeable, AutoCloseable, VWLearner, VWTypedLearner<ActionScores>

# Future Work

---

What's next

- More unified build system
- Static linking for JNI layer (only available with Java 8 and above)
- More pure functions in VW that allow easier usage as a library
- Multiple passes requires a global lock

Thank You
